

IF2130 – Organisasi dan Arsitektur Komputer

sumber: Greg Kesden, CMU 15-213, 2012

Representasi Informasi

Achmad Imam Kistijantoro (imam@staff.stei.itb.ac.id)

Robithoh Annur (robithoh@staff.stei.itb.ac.id)

Bara Timur (bara@staff.stei.itb.ac.id)

Monterico Adrian (monterico@staff.stei.itb.ac.id)

Representasi Biner

Encoding Byte Values

- ▶ Byte = 8 bit
- ▶ 00000000_2 hingga 11111111_2
- ▶ Desimal 0 – 255
- ▶ Hexadesimal 00 – FF
 - ▶ 0xdeadbeef
 - ▶ 0xc0ffee

Organisasi Memori Berorientasi Byte

- ▶ Program mengakses lokasi berbasis virtual memori
- ▶ terdiri atas array byte yang sangat besar
- ▶ diimplementasikan sebagai hierarki dari beberapa jenis memori
- ▶ sistem menyediakan private address space ke proses
 - ▶ program dijalankan dan tidak saling mengganggu program lain
- ▶ **Compiler + Runtime system mengontrol alokasi**
 - ▶ dimana berbagai objek program harus disimpan
 - ▶ semua alokasi berada pada virtual address space yang tunggal

Machine Words

▶ **Mesin memiliki “Word Size”**

- ▶ Ukuran nominal data bernilai integer
 - ▶ Termasuk addresses
- ▶ Umumnya, mesin sekarang menggunakan 32 bits (4 bytes) words
 - ▶ Batas alamat 4GB
 - ▶ Terlalu kecil untuk aplikasi yang memerlukan memori intensif
- ▶ High-end systems menggunakan 64 bits (8 bytes) words
 - ▶ Potential address space $\approx 1.8 \times 10^{19}$ bytes
 - ▶ x86-64 machines support 48-bit addresses: 256 Terabytes
- ▶ Machines support multiple data formats
 - ▶ Fractions or multiples of word size
 - ▶ Always integral number of bytes

Word Oriented Memory Organization

► Addresses Specify Byte Locations

- Address of first byte in word
- Addresses of successive words differ by 4 (32-bit) or 8 (64-bit)

Representasi Data

| C Data Type | Typical 32-bit | Intel IA32 | x86-64 |
|-------------|----------------|------------|--------|
| char | 1 | 1 | 1 |
| short | 2 | 2 | 2 |
| int | 4 | 4 | 4 |
| long | 4 | 4 | 8 |
| long long | 8 | 8 | 8 |
| float | 4 | 4 | 4 |
| double | 8 | 8 | 8 |
| long double | 8 | 10/12 | 10/16 |
| pointer | 4 | 4 | 8 |

Byte Ordering

- ▶ **How should bytes within a multi-byte word be ordered in memory?**
- ▶ **Conventions**
 - ▶ Big Endian: Sun, PPC Mac, Internet
 - ▶ Least significant byte has highest address
 - ▶ Little Endian: x86
 - ▶ Least significant byte has lowest address

Big Endian

Little Endian

Melihat representasi data

► Code untuk mencetak representasi data

```
typedef unsigned char *pointer;

void show_bytes(pointer start, int len){
    int i;
    for (i = 0; i < len; i++)
        printf("%p\t0x%.2x\n", start+i, start[i]);
    printf("\n");
}
```

Printf directives:

%p: Print pointer

%x: Print Hexadecimal

```
int a = 15213;  
printf("int a = 15213;\n");  
show_bytes((pointer) &a, sizeof(int));
```

Result (Linux):

```
int a = 15213;  
0x11ffffcb8 0x6d  
0x11ffffcb9 0x3b  
0x11ffffcba 0x00  
0x11ffffcbb 0x00
```

Representing Integers

Decimal: 15213

Binary: 0011 1011 0110 1101

Hex: 3 B 6 D

int A = 15213;

long int C = 15213;

int B = -15213;

Two's complement representation

Representing Pointers

```
int B = -15213;  
int *P = &B;
```

| Sun | IA32 | x86-64 |
|-----|------|--------|
| EF | D4 | 0C |
| FF | F8 | 89 |
| FB | FF | EC |
| 2C | BF | FF |
| | | FF |
| | | 7F |
| | | 00 |
| | | 00 |

Different compilers & machines assign different locations to objects

Representing Strings

```
char S[6] = "18243";
```

▶ Strings in C

- ▶ Represented by array of characters
- ▶ Each character encoded in ASCII format
 - ▶ Standard 7-bit encoding of character set
 - ▶ Character "0" has code 0x30
 - Digit i has code $0x30+i$
- ▶ String should be null-terminated
 - ▶ Final character = 0

▶ Compatibility

- ▶ Byte ordering not an issue

Linux/Alpha

Sun

| | | |
|----|---|----|
| 31 | ↔ | 31 |
| 38 | ↔ | 38 |
| 32 | ↔ | 32 |
| 34 | ↔ | 34 |
| 33 | ↔ | 33 |
| 00 | ↔ | 00 |

Boolean Algebra

- ▶ Developed by George Boole in 19th Century
 - ▶ Algebraic representation of logic
 - ▶ Encode “True” as 1 and “False” as 0

And

- $A \& B = 1$ when both $A=1$ and $B=1$

| $\&$ | 0 | 1 |
|------|---|---|
| 0 | 0 | 0 |
| 1 | 0 | 1 |

Or

- $A | B = 1$ when either $A=1$ or $B=1$

| $ $ | 0 | 1 |
|-----|---|---|
| 0 | 0 | 1 |
| 1 | 1 | 1 |

Not

- $\sim A = 1$ when $A=0$

| \sim | |
|--------|---|
| 0 | 1 |
| 1 | 0 |

Exclusive-Or (Xor)

- $A \wedge B = 1$ when either $A=1$ or $B=1$, but not both

| \wedge | 0 | 1 |
|----------|---|---|
| 0 | 0 | 1 |
| 1 | 1 | 0 |

General Boolean Algebras

- ▶ Operate on Bit Vectors

- ▶ Operations applied bitwise

| | | | |
|-------------------|-------------------|-------------------|-------------------|
| 01101001 | 01101001 | 01101001 | |
| & 01010101 | 01010101 | ^ 01010101 | ~ 01010101 |
| <u> </u> | <u> </u> | <u> </u> | <u> </u> |
| 01000001 | 01111101 | 00111100 | 10101010 |

- ▶ All of the Properties of Boolean Algebra Apply

Example: Representing & Manipulating Sets

► Representation

- Width w bit vector represents subsets of $\{0, \dots, w-1\}$
- $a_j = 1$ if $j \in A$

► 01101001 { 0, 3, 5, 6 }

► 76543210

► 01010101 { 0, 2, 4, 6 }

► 76543210

► Operations

- | | | | |
|-----|----------------------|----------|----------------------|
| ► & | Intersection | 01000001 | { 0, 6 } |
| ► | Union | 01111101 | { 0, 2, 3, 4, 5, 6 } |
| ► ^ | Symmetric difference | 00111100 | { 2, 3, 4, 5 } |
| ► ~ | Complement | 10101010 | { 1, 3, 5, 7 } |

Bit-Level Operations in C

- ▶ Operations $\&$, $|$, \sim , \wedge Available in C
 - ▶ Apply to any “integral” data type
 - ▶ long, int, short, char, unsigned
 - ▶ View arguments as bit vectors
 - ▶ Arguments applied bit-wise
- ▶ Examples (Char data type)
 - ▶ $\sim 0x41 = 0xBE$
 - ▶ $\sim 01000001_2 = 10111110_2$
 - ▶ $\sim 0x00 = 0xFF$
 - ▶ $\sim 00000000_2 = 11111111_2$
 - ▶ $0x69 \& 0x55 = 0x41$
 - ▶ $01101001_2 \& 01010101_2 = 01000001_2$
 - ▶ $0x69 | 0x55 = 0x7D$
 - ▶ $01101001_2 | 01010101_2 = 01111101_2$

Contrast: Logic Operations in C

▶ Contrast to Logical Operators

- ▶ `&&`, `||`, `!`
 - ▶ View 0 as “False”
 - ▶ Anything nonzero as “True”
 - ▶ Always return 0 or 1
 - ▶ **Early termination**

▶ Examples (char data type)

- ▶ `!0x41 = 0x00`
- ▶ `!0x00 = 0x01`
- ▶ `!!0x41 = 0x01`
- ▶ `0x69 && 0x55 = 0x01`
- ▶ `0x69 || 0x55 = 0x01`
- ▶ `p && *p` (avoids null pointer access)

Contrast: Logic Operations in C

▶ Contrast to Logical Operators

- ▶ `&&`, `||`, `!`

- ▶ View 0 as “False”
- ▶ Anything non-zero as “True”
- ▶ Always evaluates both sides
- ▶ **Early** evaluation

▶ Example

- ▶ `!0x41` = 0
- ▶ `!0x00` = 1
- ▶ `!!0x41` = 1
- ▶ `0x69 && 0x55` = 0x01
- ▶ `0x69 || 0x55` = 0x01
- ▶ `p && *p` (avoids null pointer access)

Watch out for `&&` vs. `&` (and `||` vs. `|`)...

one of the more common oopsies in C programming

Shift Operations

- ▶ **Left Shift:** $x \ll y$
 - ▶ Shift bit-vector x left y positions
 - Throw away extra bits on left
 - ▶ Fill with 0's on right
- ▶ **Right Shift:** $x \gg y$
 - ▶ Shift bit-vector x right y positions
 - ▶ Throw away extra bits on right
 - ▶ Logical shift
 - ▶ Fill with 0's on left
 - ▶ Arithmetic shift
 - ▶ Replicate most significant bit on left
- ▶ **Undefined Behavior**
 - ▶ Shift amount < 0 or \geq word size

| | |
|----------------|----------|
| Argument x | 01100010 |
| $\ll 3$ | 00010000 |
| Log. $\gg 2$ | 00011000 |
| Arith. $\gg 2$ | 00011000 |

| | |
|----------------|----------|
| Argument x | 10100010 |
| $\ll 3$ | 00010000 |
| Log. $\gg 2$ | 00101000 |
| Arith. $\gg 2$ | 11101000 |

Encoding Integers

Unsigned

$$B2U(X) = \sum_{i=0}^{w-1} x_i \cdot 2^i$$

Two's Complement

$$B2T(X) = -x_{w-1} \cdot 2^{w-1} + \sum_{i=0}^{w-2} x_i \cdot 2^i$$

```
short int x = 15213;  
short int y = -15213;
```

Sign
Bit

► C short 2 bytes long

| | Decimal | Hex | Binary |
|----------|---------|-------|-------------------|
| x | 15213 | 3B 6D | 00111011 01101101 |
| y | -15213 | C4 93 | 11000100 10010011 |

► Sign Bit

- For 2's complement, most significant bit indicates sign
 - 0 for nonnegative
 - 1 for negative

Two-complement Encoding Example (Cont.)

$x =$ 15213: 00111011 01101101
 $y =$ -15213: 11000100 10010011

| Weight | 15213 | | -15213 | |
|------------|--------------|------|---------------|--------|
| 1 | 1 | 1 | 1 | 1 |
| 2 | 0 | 0 | 1 | 2 |
| 4 | 1 | 4 | 0 | 0 |
| 8 | 1 | 8 | 0 | 0 |
| 16 | 0 | 0 | 1 | 16 |
| 32 | 1 | 32 | 0 | 0 |
| 64 | 1 | 64 | 0 | 0 |
| 128 | 0 | 0 | 1 | 128 |
| 256 | 1 | 256 | 0 | 0 |
| 512 | 1 | 512 | 0 | 0 |
| 1024 | 0 | 0 | 1 | 1024 |
| 2048 | 1 | 2048 | 0 | 0 |
| 4096 | 1 | 4096 | 0 | 0 |
| 8192 | 1 | 8192 | 0 | 0 |
| 16384 | 0 | 0 | 1 | 16384 |
| -32768 | 0 | 0 | 1 | -32768 |
| Sum | 15213 | | -15213 | |

Numeric Ranges

▶ Unsigned Values

- ▶ $UMin = 0$
000...0
- ▶ $UMax = 2^w - 1$
111...1

▶ Two's Complement Values

- ▶ $TMin = -2^{w-1}$
100...0
- ▶ $TMax = 2^{w-1} - 1$
011...1

▶ Other Values

- ▶ Minus 1
111...1

Values for $W = 16$

| | Decimal | Hex | Binary |
|-------------|---------------|--------------|--------------------------|
| UMax | 65535 | FF FF | 11111111 11111111 |
| TMax | 32767 | 7F FF | 01111111 11111111 |
| TMin | -32768 | 80 00 | 10000000 00000000 |
| -1 | -1 | FF FF | 11111111 11111111 |
| 0 | 0 | 00 00 | 00000000 00000000 |

Values for Different Word Sizes

| | W | | | |
|------|------|---------|----------------|----------------------------|
| | 8 | 16 | 32 | 64 |
| UMax | 255 | 65,535 | 4,294,967,295 | 18,446,744,073,709,551,615 |
| TMax | 127 | 32,767 | 2,147,483,647 | 9,223,372,036,854,775,807 |
| TMin | -128 | -32,768 | -2,147,483,648 | -9,223,372,036,854,775,808 |

► Observations

- $|TMin| = TMax + 1$
 - Asymmetric range
- $UMax = 2 * TMax + 1$

■ C Programming

- `#include <limits.h>`
- Declares constants, e.g.,
 - `ULONG_MAX`
 - `LONG_MAX`
 - `LONG_MIN`
- Values platform specific

Unsigned & Signed Numeric Values

| X | $B2U(X)$ | $B2T(X)$ |
|------|----------|----------|
| 0000 | 0 | 0 |
| 0001 | 1 | 1 |
| 0010 | 2 | 2 |
| 0011 | 3 | 3 |
| 0100 | 4 | 4 |
| 0101 | 5 | 5 |
| 0110 | 6 | 6 |
| 0111 | 7 | 7 |
| 1000 | 8 | -8 |
| 1001 | 9 | -7 |
| 1010 | 10 | -6 |
| 1011 | 11 | -5 |
| 1100 | 12 | -4 |
| 1101 | 13 | -3 |
| 1110 | 14 | -2 |
| 1111 | 15 | -1 |

► Equivalence

- Same encodings for nonnegative values

► Uniqueness

- Every bit pattern represents unique integer value
- Each representable integer has unique bit encoding

► \Rightarrow Can Invert Mappings

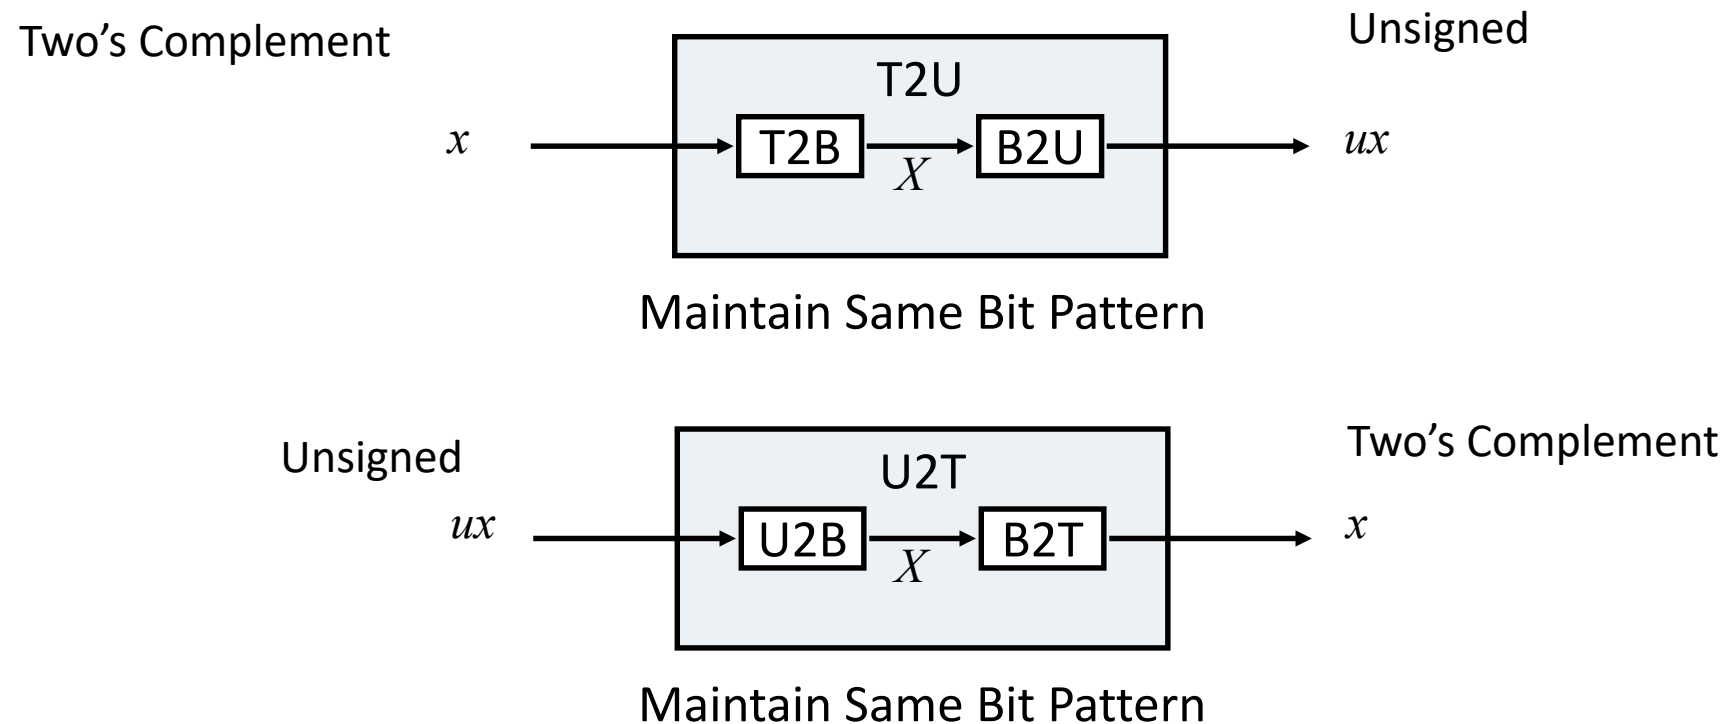

- $U2B(x) = B2U^{-1}(x)$
 - Bit pattern for unsigned integer
- $T2B(x) = B2T^{-1}(x)$
 - Bit pattern for two's comp integer

Today: Bits, Bytes, and Integers

- ▶ Representing information as bits
- ▶ Bit-level manipulations
- ▶ **Integers**
 - ▶ Representation: unsigned and signed
 - ▶ **Conversion, casting**
 - ▶ Expanding, truncating
 - ▶ Addition, negation, multiplication, shifting
 - ▶ Summary
- ▶ Representations in memory, pointers, strings

Mapping Between Signed & Unsigned

- Mappings between unsigned and two's complement numbers:
keep bit representations and reinterpret

Mapping Signed \leftrightarrow Unsigned

| Bits | Signed | | Unsigned |
|------|--------|---------|----------|
| 0000 | 0 | | 0 |
| 0001 | 1 | | 1 |
| 0010 | 2 | | 2 |
| 0011 | 3 | | 3 |
| 0100 | 4 | | 4 |
| 0101 | 5 | → T2U → | 5 |
| 0110 | 6 | | 6 |
| 0111 | 7 | ← U2T ← | 7 |
| 1000 | -8 | | 8 |
| 1001 | -7 | | 9 |
| 1010 | -6 | | 10 |
| 1011 | -5 | | 11 |
| 1100 | -4 | | 12 |
| 1101 | -3 | | 13 |
| 1110 | -2 | | 14 |
| 1111 | -1 | | 15 |

Mapping Signed \leftrightarrow Unsigned

| Bits | Signed | | Unsigned |
|------|--------|---------------------------------|----------|
| 0000 | 0 | \longleftrightarrow = | 0 |
| 0001 | 1 | | 1 |
| 0010 | 2 | | 2 |
| 0011 | 3 | | 3 |
| 0100 | 4 | | 4 |
| 0101 | 5 | | 5 |
| 0110 | 6 | | 6 |
| 0111 | 7 | | 7 |
| 1000 | -8 | \longleftrightarrow +/- 16 | 8 |
| 1001 | -7 | | 9 |
| 1010 | -6 | | 10 |
| 1011 | -5 | | 11 |
| 1100 | -4 | | 12 |
| 1101 | -3 | | 13 |
| 1110 | -2 | | 14 |
| 1111 | -1 | | 15 |

Relation between Signed & Unsigned

Two's Complement

Maintain Same Bit Pattern

Large negative weight
becomes
Large positive weight

Conversion Visualized

- ▶ 2's Comp. → Unsigned
 - ▶ Ordering Inversion
 - ▶ Negative → Big Positive

Signed vs. Unsigned in C

▶ Constants

- ▶ By default are considered to be signed integers
- ▶ Unsigned if have “U” as suffix
`0U, 4294967259U`

▶ Casting

- ▶ Explicit casting between signed & unsigned same as U2T and T2U

```
int tx, ty;  
unsigned ux, uy;  
tx = (int) ux;  
uy = (unsigned) ty;
```

- ▶ Implicit casting also occurs via assignments and procedure calls

```
tx = ux;  
uy = ty;
```

Casting Surprises

▶ Expression Evaluation

- ▶ If there is a mix of unsigned and signed in single expression, ***signed values implicitly cast to unsigned***
- ▶ Including comparison operations $<$, $>$, $==$, $<=$, $>=$
- ▶ Examples for $W = 32$: **$TMIN = -2,147,483,648$, $TMAX = 2,147,483,647$**

| ▶ Constant ₁ | Constant ₂ | Relation | Evaluation |
|-------------------------|-----------------------|----------|------------|
| 0 | 0U | $==$ | unsigned |
| -1 | 0 | $<$ | signed |
| -1 | 0U | $>$ | unsigned |
| 2147483647 | (-2147483647)-1 | $>$ | signed |
| 2147483647U | -2147483647-1 | $<$ | unsigned |
| -1 | -2 | $>$ | signed |
| (unsigned)-1 | -2 | $>$ | unsigned |
| 2147483647 | 2147483648U | $<$ | unsigned |
| ▶ 2147483647 | (int) 2147483648U | $>$ | signed |

Summary

Casting Signed \leftrightarrow Unsigned: Basic Rules

- ▶ Bit pattern is maintained
- ▶ But reinterpreted
- ▶ Can have unexpected effects: adding or subtracting 2^w
- ▶ Expression containing signed and unsigned int
 - ▶ `int` is cast to `unsigned`!!

Today: Bits, Bytes, and Integers

- ▶ Representing information as bits
- ▶ Bit-level manipulations
- ▶ **Integers**
 - ▶ Representation: unsigned and signed
 - ▶ Conversion, casting
 - ▶ **Expanding, truncating**
 - ▶ Addition, negation, multiplication, shifting
 - ▶ Summary
- ▶ Representations in memory, pointers, strings

Sign Extension

► Task:

- Given w -bit signed integer x
- Convert it to $w+k$ -bit integer with same value

► Rule:

- Make k copies of sign bit:
- $X' = \underbrace{x_{w-1}, \dots, x_{w-1}}_{k \text{ copies of MSB}}, x_{w-1}, x_{w-2}, \dots, x_0$

Sign Extension Example

```
short int x = 15213;  
int      ix = (int) x;  
short int y = -15213;  
int      iy = (int) y;
```

| | Decimal | Hex | Binary |
|----|---------|-------------|-------------------------------------|
| x | 15213 | 3B 6D | 00111011 01101101 |
| ix | 15213 | 00 00 3B 6D | 00000000 00000000 00111011 01101101 |
| y | -15213 | C4 93 | 11000100 10010011 |
| iy | -15213 | FF FF C4 93 | 11111111 11111111 11000100 10010011 |

- ▶ Converting from smaller to larger integer data type
- ▶ C automatically performs sign extension

Summary:

Expanding, Truncating: Basic Rules

- ▶ Expanding (e.g., short int to int)
 - ▶ Unsigned: zeros added
 - ▶ Signed: sign extension
 - ▶ Both yield expected result
- ▶ Truncating (e.g., unsigned to unsigned short)
 - ▶ Unsigned/signed: bits are truncated
 - ▶ Result reinterpreted
 - ▶ Unsigned: mod operation
 - ▶ Signed: similar to mod
 - ▶ For small numbers yields expected behaviour

Today: Bits, Bytes, and Integers

- ▶ Representing information as bits
- ▶ Bit-level manipulations
- ▶ **Integers**
 - ▶ Representation: unsigned and signed
 - ▶ Conversion, casting
 - ▶ Expanding, truncating
 - ▶ **Addition, negation, multiplication, shifting**
- ▶ Representations in memory, pointers, strings
- ▶ Summary

Unsigned Addition

Operands: w bits

True Sum: $w+1$ bits

Discard Carry: w bits

- ▶ **Standard Addition Function**

- ▶ Ignores carry output

- ▶ **Implements Modular Arithmetic**

$$s = \text{UAdd}_w(u, v) = u + v \bmod 2^w$$

Visualizing (Mathematical) Integer Addition

► Integer Addition

- 4-bit integers u, v
- Compute true sum $\text{Add}_4(u, v)$
- Values increase linearly with u and v
- Forms planar surface

Visualizing Unsigned Addition

► Wraps Around

- If true sum $\geq 2^w$
- At most once

Two's Complement Addition

Operands: w bits

True Sum: $w+1$ bits

Discard Carry: w bits

▶ TAdd and UAdd have Identical Bit-Level Behavior

▶ Signed vs. unsigned addition in C:

```
int s, t, u, v;
```

```
s = (int) ((unsigned) u + (unsigned) v);
```

```
t = u + v
```

▶ Will give `s == t`

TAdd Overflow

► Functionality

- True sum requires $w+1$ bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

Visualizing 2's Complement Addition

► Values

- 4-bit two's comp.
- Range from -8 to +7

► Wraps Around

- If $\text{sum} \geq 2^{w-1}$
 - Becomes negative
 - At most once
- If $\text{sum} < -2^{w-1}$
 - Becomes positive
 - At most once

NegOver

Multiplication

- ▶ Goal: Computing Product of w -bit numbers x, y
 - ▶ Either signed or unsigned
- ▶ But, exact results can be bigger than w bits
 - ▶ Unsigned: up to $2w$ bits
 - ▶ Result range: $0 \leq x * y \leq (2^w - 1)^2 = 2^{2w} - 2^{w+1} + 1$
 - ▶ Two's complement min (negative): Up to $2w-1$ bits
 - ▶ Result range: $x * y \geq (-2^{w-1})*(2^{w-1}-1) = -2^{2w-2} + 2^{w-1}$
 - ▶ Two's complement max (positive): Up to $2w$ bits, but only for $(TMin_w)^2$
 - ▶ Result range: $x * y \leq (-2^{w-1})^2 = 2^{2w-2}$
- ▶ So, maintaining exact results...
 - ▶ would need to keep expanding word size with each product computed
 - ▶ is done in software, if needed
 - ▶ e.g., by “arbitrary precision” arithmetic packages

Unsigned Multiplication in C

Operands: w bits

True Product: $2*w$ bits

Discard w bits: w bits

- ▶ **Standard Multiplication Function**
 - ▶ Ignores high order w bits
- ▶ **Implements Modular Arithmetic**
$$\text{UMult}_w(u, v) = u \cdot v \bmod 2^w$$

Signed Multiplication in C

Operands: w bits

True Product: $2*w$ bits

Discard w bits: w bits

▶ Standard Multiplication Function

- ▶ Ignores high order w bits
- ▶ Some of which are different for signed vs. unsigned multiplication
- ▶ Lower bits are the same

Power-of-2 Multiply with Shift

▶ Operation

- ▶ $u \ll k$ gives $u * 2^k$
- ▶ Both signed and unsigned

Operands: w bits

True Product: $w+k$ bits

Discard k bits: w bits

▶ Examples

- ▶ $u \ll 3 \quad == \quad u * 8$
- ▶ $u \ll 5 - u \ll 3 \quad == \quad u * 24$
- ▶ Most machines shift and add faster than multiply
 - ▶ Compiler generates this code automatically

Unsigned Power-of-2 Divide with Shift

▶ Quotient of Unsigned by Power of 2

- ▶ $u \gg k$ gives $\lfloor u / 2^k \rfloor$
- ▶ Uses logical shift

| | Division | Computed | Hex | Binary |
|---------------------|-------------------|--------------|--------------|--------------------------|
| x | 15213 | 15213 | 3B 6D | 00111011 01101101 |
| x >> 1 | 7606.5 | 7606 | 1D B6 | 00011101 10110110 |
| x >> 4 | 950.8125 | 950 | 03 B6 | 00000011 10110110 |
| x >> 8 | 59.4257813 | 59 | 00 3B | 00000000 00111011 |

Signed Power-of-2 Divide with Shift

▶ Quotient of Signed by Power of 2

- ▶ $x \gg k$ gives $\lfloor x / 2^k \rfloor$
- ▶ Uses arithmetic shift
- ▶ Rounds wrong direction when $u < 0$

| | Division | Computed | Hex | Binary |
|---------------------|--------------------|---------------|--------------|--------------------------|
| y | -15213 | -15213 | C4 93 | 11000100 10010011 |
| y >> 1 | -7606.5 | -7607 | E2 49 | 11100010 01001001 |
| y >> 4 | -950.8125 | -951 | FC 49 | 11111100 01001001 |
| y >> 8 | -59.4257813 | -60 | FF C4 | 11111111 11000100 |

Correct Power-of-2 Divide

- ▶ Quotient of Negative Number by Power of 2
 - ▶ Want $\lceil x / 2^k \rceil$ (Round Toward 0)
 - ▶ Compute as $\lfloor (x + 2^k - 1) / 2^k \rfloor$
 - ▶ In C: $(x + (1 \ll k) - 1) \gg k$
 - ▶ Biases dividend toward 0

Case I: No rounding

Dividend:

$+2^k - 1$

Divisor:

$/ 2^k$

$\lceil u / 2^k \rceil$

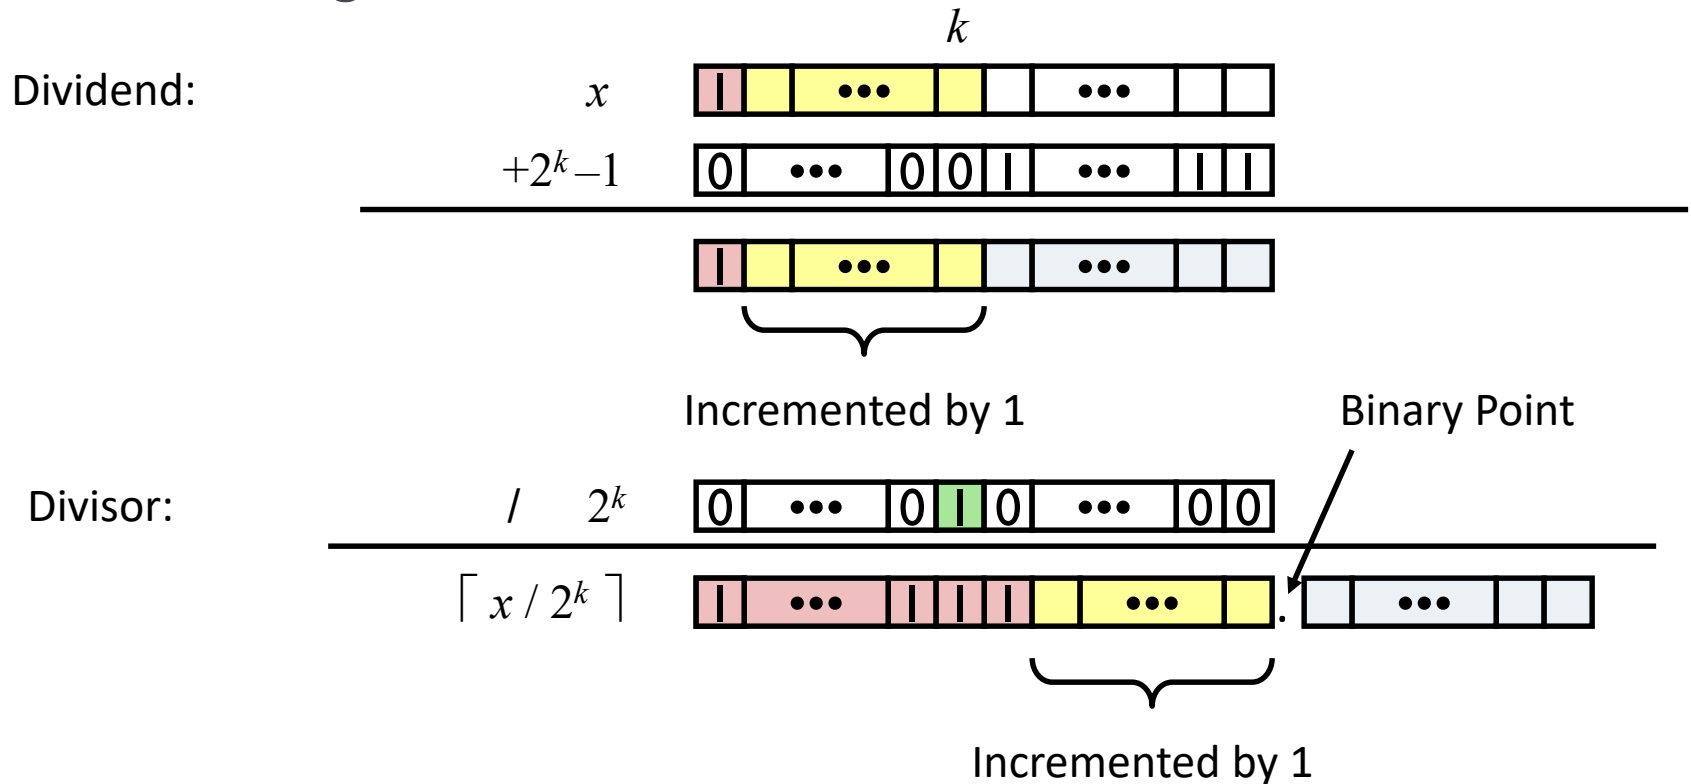

Biasing has no effect

Correct Power-of-2 Divide (Cont.)

Case 2: Rounding

Biasing adds 1 to final result

Today: Bits, Bytes, and Integers

- ▶ Representing information as bits
- ▶ Bit-level manipulations
- ▶ **Integers**
 - ▶ Representation: unsigned and signed
 - ▶ Conversion, casting
 - ▶ Expanding, truncating
 - ▶ Addition, negation, multiplication, shifting
 - ▶ **Summary**
- ▶ Representations in memory, pointers, strings

Arithmetic: Basic Rules

▶ Addition:

- ▶ Unsigned/signed: Normal addition followed by truncate, same operation on bit level
- ▶ Unsigned: addition mod 2^w
 - ▶ Mathematical addition + possible subtraction of 2^w
- ▶ Signed: modified addition mod 2^w (result in proper range)
 - ▶ Mathematical addition + possible addition or subtraction of 2^w

▶ Multiplication:

- ▶ Unsigned/signed: Normal multiplication followed by truncate, same operation on bit level
- ▶ Unsigned: multiplication mod 2^w
- ▶ Signed: modified multiplication mod 2^w (result in proper range)

Why Should I Use Unsigned?

- ▶ *Don't Use Just Because Number Nonnegative*

- ▶ Easy to make mistakes

```
unsigned i;  
for (i = cnt-2; i >= 0; i--)  
    a[i] += a[i+1];
```

- ▶ Can be very subtle

```
#define DELTA sizeof(int)  
int i;  
for (i = CNT; i-DELTA >= 0; i-= DELTA)  
    . . .
```

- ▶ *Do Use When Performing Modular Arithmetic*

- ▶ Multiprecision arithmetic

- ▶ *Do Use When Using Bits to Represent Sets*

- ▶ Logical right shift, no sign extension
